## DETAILED ACTION

### ***Claim Rejections - 35 USC § 102***

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1, 4-5 are rejected under 35 U.S.C. 102(b) as anticipated by or, in the alternative, under 35 U.S.C. 103(a) as obvious over Anani (5,449,576).

Anani teaches in Figure 2 and column 3, line 28 to column 4, line 12, an electrochemical cell comprising a negative electrode, a positive electrode and a primary and secondary electrolyte. The negative electrode comprises elemental Li. The secondary electrolyte is disposed between the primary electrolyte and the negative electrode. Anani teaches in columns 5-6, that the secondary electrolyte is fabricated of lithium ion conducting glass comprising a lithium conducting salt, a glass former and a glass modifier. The modifier can be Li<sub>2</sub>S and the glass former can be P<sub>2</sub>S<sub>5</sub>, P<sub>2</sub>O<sub>5</sub>, and combinations thereof. Anani teaches in column 5, lines 29-40, that the secondary

electrolyte can be deposited by sputtering.

Since Anani teaches the same starting material compositions, Li<sub>2</sub>S, P<sub>2</sub>S<sub>5</sub> and P<sub>2</sub>O<sub>5</sub> to form the inorganic solid electrolyte then inherently the same inorganic solid electrolyte containing specified atomic ranges for Li, P, S and O would also be obtained.

In addition, the presently claimed property of the inorganic solid electrolyte containing the specified atomic fraction for Li, P, S and O would have obviously have been present once the Anani product is provided. *In re Best*, 195 USPQ 433 (CCPA 1977).

***Allowable Subject Matter***

4. Claims 2-3 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
